# Preface

Here we will mainly follows [1]. We will assume all rings are commutative with unit. We assume the reader know the basic algebra an some homological algebra, including basic theory of groups, rings, modules, basic things of spectrum of rings and its basic properties, abelian categories, derived categories and derived functors.

# Chapter 1

## Rings, Ideals and Modules

### 1.1 Basic Properties

**Lemma 1.1.1.** *Let  $R$  be a ring and let  $M$  be an  $R$ -module. Then there exists a directed system of finitely presented  $R$ -modules  $M_i$  such that  $M \cong \varinjlim M_i$ .*

*Proof.* Consider any finite subset  $S \subset M$  and any finite collection of relations  $E$  among the elements of  $S$ . So each  $s \in S$  corresponds to  $x_s \in M$  and each  $e \in E$  consists of a vector of elements  $f_{e,s} \in R$  such that  $\sum f_{e,s}x_s = 0$ . Let  $M_{S,E}$  be the cokernel of the map

$$R^{\#E} \longrightarrow R^{\#S}, \quad (g_e)_{e \in E} \longmapsto \left( \sum g_e f_{e,s} \right)_{s \in S}.$$

There are canonical maps  $M_{S,E} \rightarrow M$ . If  $S \subset S'$  and if the elements of  $E$  correspond, via this map, to relations in  $E'$ , then there is an obvious map  $M_{S,E} \rightarrow M_{S',E'}$  commuting with the maps to  $M$ . Let  $I$  be the set of pairs  $(S, E)$  with ordering by inclusion as above. It is clear that the colimit of this directed system is  $M$ .  $\square$

**Proposition 1.1.2.** *Let  $R$  be a ring. Let  $N$  be an  $R$ -module. The following are equivalent*

- (1)  *$N$  is a finitely generated (finitely presented)  $R$ -module.*
- (2) *for any filtered colimit  $M = \varinjlim M_i$  of  $R$ -modules the map*

$$\varinjlim \operatorname{Hom}_R(N, M_i) \rightarrow \operatorname{Hom}_R(N, M)$$

*is injective (bijective).*

*Proof.* Consider the case of finitely generated: Assume (1) and choose generators  $x_1, \dots, x_m$  for  $N$ . If  $N \rightarrow M_i$  is a module map and the composition  $N \rightarrow M_i \rightarrow M$  is zero, then because  $M = \varinjlim_{i' \geq i} M_{i'}$  for each  $j \in \{1, \dots, m\}$  we can find a  $i' \geq i$  such that  $x_j$  maps

to zero in  $M_{i'}$ . Since there are finitely many  $x_j$  we can find a single  $i'$  which works for all of them. Then the composition  $N \rightarrow M_i \rightarrow M_{i'}$  is zero and we conclude the map is injective, i.e., part (2) holds.

Assume (2). For a finite subset  $E \subset N$  denote  $N_E \subset N$  the  $R$ -submodule generated by the elements of  $E$ . Then  $0 = \varinjlim N/N_E$  is a filtered colimit. Hence we see that  $\text{id} : N \rightarrow N$  maps into  $N_E$  for some  $E$ , i.e.,  $N$  is finitely generated.

Consider the case of finitely presented: Assume (1) and choose an exact sequence  $F_{-1} \rightarrow F_0 \rightarrow N \rightarrow 0$  with  $F_i$  finite free. Then we have an exact sequence

$$0 \rightarrow \text{Hom}_R(N, M) \rightarrow \text{Hom}_R(F_0, M) \rightarrow \text{Hom}_R(F_{-1}, M)$$

functorial in the  $R$ -module  $M$ . The functors  $\text{Hom}_R(F_i, M)$  commute with filtered colimits as  $\text{Hom}_R(R^{\oplus n}, M) = M^{\oplus n}$ . Since filtered colimits are exact, we see that (2) holds.

Assume (2). By Lemma 1.1.1 we can write  $N = \varinjlim N_i$  as a filtered colimit such that  $N_i$  is of finite presentation for all  $i$ . Thus  $\text{id}_N$  factors through  $N_i$  for some  $i$ . This means that  $N$  is a direct summand of a finitely presented  $R$ -module (namely  $N_i$ ) and hence finitely presented.  $\square$

**Proposition 1.1.3.** *Let  $R$  be a ring, and let  $M$  be a finitely generated  $R$ -module. There exists a filtration by  $R$ -submodules*

$$0 = M_0 \subset M_1 \subset \cdots \subset M_n = M$$

*such that each quotient  $M_i/M_{i-1}$  is isomorphic to  $R/I_i$  for some ideal  $I_i \subset R$ .*

*Proof.* By induction on the number of generators of  $M$ . Let  $x_1, \dots, x_r \in M$  be a minimal number of generators. Let  $M' := Rx_1 \subset M$ . Then  $M/M'$  has  $r-1$  generators and the induction hypothesis applies. And clearly  $M' \cong R/\text{ann}(x_1)$ , well done.  $\square$

## 1.2 Localizations

**Definition 1.2.1.** *Let  $R$  be a ring,  $S$  a subset of  $R$ . We say  $S$  is a **multiplicative subset** of  $R$  if  $1 \in S$  and  $S$  is closed under multiplication, i.e.,  $s, s' \in S \Rightarrow ss' \in S$ .*

**Definition 1.2.2.** *Given a ring  $A$  and a multiplicative subset  $S$ , we define a relation on  $A \times S$  as follows:*

$$(x, s) \sim (y, t) \Leftrightarrow \exists u \in S \text{ such that } (xt - ys)u = 0.$$

*It is easily checked that this is an equivalence relation. Let  $x/s$  be the equivalence class of  $(x, s)$  and  $S^{-1}A$  be the set of all equivalence classes. Define addition and multiplication in  $S^{-1}A$  as follows:*

$$x/s + y/t = (xt + ys)/st, \quad x/s \cdot y/t = xy/st.$$

One can check that  $S^{-1}A$  becomes a ring under these operations. Then this ring is called the *localization of  $A$  with respect to  $S$* .

We have a natural ring map from  $A$  to its localization  $S^{-1}A$ ,

$$A \longrightarrow S^{-1}A, \quad x \longmapsto x/1$$

which is sometimes called the *localization map*. In general the localization map is not injective, unless  $S$  contains no zerodivisors.

The localization of a ring has the following universal property.

**Proposition 1.2.3.** *Let  $f : A \rightarrow B$  be a ring map that sends every element in  $S$  to a unit of  $B$ . Then there is a unique homomorphism  $g : S^{-1}A \rightarrow B$  such that the following diagram commutes.*

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ & \searrow & \nearrow \exists! g \\ & S^{-1}A & \end{array}$$

*Proof.* Existence. We define a map  $g$  as follows. For  $x/s \in S^{-1}A$ , let  $g(x/s) = f(x)f(s)^{-1} \in B$ . It is easily checked from the definition that this is a well-defined ring map. And it is also clear that this makes the diagram commutative.

Uniqueness. We now show that if  $g' : S^{-1}A \rightarrow B$  satisfies  $g'(x/1) = f(x)$ , then  $g = g'$ . Hence  $f(s) = g'(s/1)$  for  $s \in S$  by the commutativity of the diagram. But then  $g'(1/s)f(s) = 1$  in  $B$ , which implies that  $g'(1/s) = f(s)^{-1}$  and hence  $g'(x/s) = g'(x/1)g'(1/s) = f(x)f(s)^{-1} = g(x/s)$ .  $\square$

**Lemma 1.2.4.** *Let  $R$  be a ring. Let  $S \subset R$  be a multiplicative subset. The category of  $S^{-1}R$ -modules is equivalent to the category of  $R$ -modules  $N$  with the property that every  $s \in S$  acts as an automorphism on  $N$ .*

*Proof.* The functor which defines the equivalence associates to an  $S^{-1}R$ -module  $M$  the same module but now viewed as an  $R$ -module via the localization map  $R \rightarrow S^{-1}R$ . Conversely, if  $N$  is an  $R$ -module, such that every  $s \in S$  acts via an automorphism  $s_N$ , then we can think of  $N$  as an  $S^{-1}R$ -module by letting  $x/s$  act via  $x_N \circ s_N^{-1}$ . We omit the verification that these two functors are quasi-inverse to each other.  $\square$

The notion of localization of a ring can be generalized to the localization of a module.

**Definition 1.2.5.** *Let  $A$  be a ring,  $S$  a multiplicative subset of  $A$  and  $M$  an  $A$ -module. We define a relation on  $M \times S$  as follows*

$$(m, s) \sim (n, t) \Leftrightarrow \exists u \in S \text{ such that } (mt - ns)u = 0.$$

This is clearly an equivalence relation. Denote by  $m/s$  be the equivalence class of  $(m, s)$  and  $S^{-1}M$  be the set of all equivalence classes. Define the addition and scalar multiplication as follows

$$m/s + n/t = (mt + ns)/st, \quad m/s \cdot n/t = mn/st.$$

It is clear that this makes  $S^{-1}M$  an  $S^{-1}A$ -module. The  $S^{-1}A$ -module  $S^{-1}M$  is called the *localization of  $M$  at  $S$* .

Note that there is an  $A$ -module map  $M \rightarrow S^{-1}M$ ,  $m \mapsto m/1$  which is also called the *localization map*. It satisfies the following similar universal property.

**Lemma 1.2.6.** *Let  $R$  be a ring. Let  $S \subset R$  a multiplicative subset. Let  $M, N$  be  $R$ -modules. Assume all the elements of  $S$  act as automorphisms on  $N$ . Then we have*

$$\begin{array}{ccc} M & \xrightarrow{\beta} & N \\ & \searrow & \nearrow \exists! \alpha \\ & S^{-1}M & \end{array}$$

Moreover, the canonical map

$$\text{Hom}_R(S^{-1}M, N) \longrightarrow \text{Hom}_R(M, N)$$

induced by the localization map, is an isomorphism.

*Proof.* It is clear that the map is well-defined and  $R$ -linear. Injectivity: Let  $\alpha \in \text{Hom}_R(S^{-1}M, N)$  and take an arbitrary element  $m/s \in S^{-1}M$ . Then, since  $s \cdot \alpha(m/s) = \alpha(m/1)$ , we have  $\alpha(m/s) = s^{-1}(\alpha(m/1))$ , so  $\alpha$  is completely determined by what it does on the image of  $M$  in  $S^{-1}M$ . Surjectivity: Let  $\beta : M \rightarrow N$  be a given  $R$ -linear map. We need to show that it can be "extended" to  $S^{-1}M$ . Define a map of sets

$$M \times S \rightarrow N, \quad (m, s) \mapsto s^{-1}\beta(m).$$

Clearly, this map respects the equivalence relation from above, so it descends to a well-defined map  $\alpha : S^{-1}M \rightarrow N$ . It remains to show that this map is  $R$ -linear, so take  $r, r' \in R$  as well as  $s, s' \in S$  and  $m, m' \in M$ . Then

$$\begin{aligned} \alpha(r \cdot m/s + r' \cdot m'/s') &= \alpha((r \cdot s' \cdot m + r' \cdot s \cdot m')/(ss')) \\ &= (ss')^{-1}\beta(r \cdot s' \cdot m + r' \cdot s \cdot m') \\ &= (ss')^{-1}(r \cdot s' \beta(m) + r' \cdot s \beta(m')) \\ &= r\alpha(m/s) + r'\alpha(m'/s') \end{aligned}$$

and we win. □

**Example 1.2.1.** Let  $A$  be a ring and let  $M$  be an  $A$ -module. Here are some important examples of localizations.

1. Given  $\mathfrak{p}$  a prime ideal of  $A$  consider  $S = A \setminus \mathfrak{p}$ . It is immediately checked that  $S$  is a multiplicative set. In this case we denote  $A_{\mathfrak{p}}$  and  $M_{\mathfrak{p}}$  the localization of  $A$  and  $M$  with respect to  $S$  respectively. These are called the *localization of  $A$ , resp.  $M$  at  $\mathfrak{p}$* .
2. Let  $f \in A$ . Consider  $S = \{1, f, f^2, \dots\}$ . This is clearly a multiplicative subset of  $A$ . In this case we denote  $A_f$  (resp.  $M_f$ ) the localization  $S^{-1}A$  (resp.  $S^{-1}M$ ). This is called the *localization of  $A$ , resp.  $M$  with respect to  $f$* . Note that  $A_f = 0$  if and only if  $f$  is nilpotent in  $A$ .
3. Let  $S = \{f \in A : f \text{ is not a zerodivisor in } A\}$ . This is a multiplicative subset of  $A$ . In this case the ring  $Q(A) = S^{-1}A$  is called either the **total quotient ring** of  $A$ .
4. If  $A$  is a domain, then the total quotient ring  $Q(A)$  is the field of fractions of  $A$ .

**Lemma 1.2.7.** Let  $R$  be a ring. Let  $S \subset R$  be a multiplicative subset. Let  $M$  be an  $R$ -module. Then

$$S^{-1}M = \varinjlim_{f \in S} M_f$$

where the preorder on  $S$  is given by  $f \geq f' \Leftrightarrow f = f'f''$  for some  $f'' \in R$  in which case the map  $M_{f'} \rightarrow M_f$  is given by  $m/(f')^e \mapsto m(f'')^e/f^e$ .

*Proof.* Omitted. Just need to check the universal property.  $\square$

**Proposition 1.2.8.** Let  $A$  denote a ring, and  $M, N$  denote modules over  $A$ . If  $S$  and  $S'$  are multiplicative sets of  $A$ , then it is clear that

$$SS' = \{ss' : s \in S, s' \in S'\}$$

is also a multiplicative set of  $A$ . Then the following holds.

- (1) Let  $\bar{S}$  be the image of  $S$  in  $S'^{-1}A$ , then  $(SS')^{-1}A$  is isomorphic to  $\bar{S}^{-1}(S'^{-1}A)$ .
- (2) View  $S'^{-1}M$  as an  $A$ -module, then  $S^{-1}(S'^{-1}M)$  is isomorphic to  $(SS')^{-1}M$ .
- (3) Let  $L \xrightarrow{u} M \xrightarrow{v} N$  be an exact sequence of  $R$ -modules. Then  $S^{-1}L \rightarrow S^{-1}M \rightarrow S^{-1}N$  is also exact.
- (4) If  $N$  is a submodule of  $M$ , then  $S^{-1}(M/N) \simeq (S^{-1}M)/(S^{-1}N)$ .
- (5) Let  $I$  be an ideal of  $A$ ,  $S$  a multiplicative set of  $A$ . Then  $S^{-1}I$  is an ideal of  $S^{-1}A$  and  $\bar{S}^{-1}(A/I)$  is isomorphic to  $S^{-1}A/S^{-1}I$ , where  $\bar{S}$  is the image of  $S$  in  $A/I$ .

(6) Any submodule  $N'$  of  $S^{-1}M$  is of the form  $S^{-1}N$  for some  $N \subset M$ . Indeed one can take  $N$  to be the inverse image of  $N'$  in  $M$ . In particular, each ideal  $I'$  of  $S^{-1}A$  takes the form  $S^{-1}I$ , where one can take  $I$  to be the inverse image of  $I'$  in  $A$ .

*Proof.* For (1), the map sending  $x \in A$  to  $x/1 \in (SS')^{-1}A$  induces a map sending  $x/s \in S'^{-1}A$  to  $x/s \in (SS')^{-1}A$ , by universal property. The image of the elements in  $\bar{S}$  are invertible in  $(SS')^{-1}A$ . By the universal property we get a map  $f : \bar{S}^{-1}(S'^{-1}A) \rightarrow (SS')^{-1}A$  which maps  $(x/t')/(s/s')$  to  $(x/t') \cdot (s/s')^{-1}$ . On the other hand, the map from  $A$  to  $\bar{S}^{-1}(S'^{-1}A)$  sending  $x \in A$  to  $(x/1)/(1/1)$  also induces a map  $g : (SS')^{-1}A \rightarrow \bar{S}^{-1}(S'^{-1}A)$  which sends  $x/ss'$  to  $(x/s')/(s/1)$ , by the universal property again. It is immediately checked that  $f$  and  $g$  are inverse to each other, hence they are both isomorphisms.

For (2), note that given a  $A$ -module  $M$ , we have not proved any universal property for  $S^{-1}M$ . Hence we cannot reason as in the preceding proof; we have to construct the isomorphism explicitly. We define the maps as follows

$$\begin{aligned} f : S^{-1}(S'^{-1}M) &\longrightarrow (SS')^{-1}M, & \frac{x/s'}{s} &\mapsto x/ss' \\ g : (SS')^{-1}M &\longrightarrow S^{-1}(S'^{-1}M), & x/t &\mapsto \frac{x/s'}{s} \text{ for some } s \in S, s' \in S', \text{ and } t = ss' \end{aligned}$$

We have to check that these homomorphisms are well-defined, that is, independent the choice of the fraction. This is easily checked and it is also straightforward to show that they are inverse to each other.

For (3), first it is clear that  $S^{-1}L \rightarrow S^{-1}M \rightarrow S^{-1}N$  is a complex since localization is a functor. Next suppose that  $x/s$  maps to zero in  $S^{-1}N$  for some  $x/s \in S^{-1}M$ . Then by definition there is a  $t \in S$  such that  $v(xt) = v(x)t = 0$  in  $M$ , which means  $xt \in \ker(v)$ . By the exactness of  $L \rightarrow M \rightarrow N$  we have  $xt = u(y)$  for some  $y$  in  $L$ . Then  $x/s$  is the image of  $y/st$ . This proves the exactness.

For (4), from the exact sequence

$$0 \longrightarrow N \longrightarrow M \longrightarrow M/N \longrightarrow 0$$

we have

$$0 \longrightarrow S^{-1}N \longrightarrow S^{-1}M \longrightarrow S^{-1}(M/N) \longrightarrow 0$$

The corollary then follows.

For (5), The fact that  $S^{-1}I$  is an ideal is clear since  $I$  itself is an ideal. Define

$$f : S^{-1}A \longrightarrow \bar{S}^{-1}(A/I), \quad x/s \mapsto \bar{x}/\bar{s}$$

where  $\bar{x}$  and  $\bar{s}$  are the images of  $x$  and  $s$  in  $A/I$ . We shall keep similar notations in this proof. This map is well-defined by the universal property of  $S^{-1}A$ , and  $S^{-1}I$  is contained in the kernel of it, therefore it induces a map

$$\bar{f} : S^{-1}A/S^{-1}I \longrightarrow \bar{S}^{-1}(A/I), \quad \overline{x/s} \mapsto \bar{x}/\bar{s}$$

On the other hand, the map  $A \rightarrow S^{-1}A/S^{-1}I$  sending  $x$  to  $\overline{x/1}$  induces a map  $A/I \rightarrow S^{-1}A/S^{-1}I$  sending  $\bar{x}$  to  $\overline{x/1}$ . The image of  $\bar{S}$  is invertible in  $S^{-1}A/S^{-1}I$ , thus induces a map

$$g : \bar{S}^{-1}(A/I) \longrightarrow S^{-1}A/S^{-1}I, \quad \frac{\bar{x}}{\bar{s}} \mapsto \overline{x/s}$$

by the universal property. It is then clear that  $\bar{f}$  and  $g$  are inverse to each other, hence are both isomorphisms.

For (6), Let  $N$  be the inverse image of  $N'$  in  $M$ . Then one can see that  $S^{-1}N \supset N'$ . To show they are equal, take  $x/s$  in  $S^{-1}N$ , where  $s \in S$  and  $x \in N$ . This yields that  $x/1 \in N'$ . Since  $N'$  is an  $S^{-1}R$ -submodule we have  $x/s = x/1 \cdot 1/s \in N'$ . This finishes the proof.  $\square$

## 1.3 Tensor Products and Flatness

### 1.3.1 Tensor Products

**Proposition 1.3.1.** *Let  $M, N$  be  $R$ -modules. Then there exists a pair  $(M \otimes_R N, g)$  where  $M \otimes_R N$  is an  $R$ -module, and  $g : M \times N \rightarrow T$  an  $R$ -bilinear mapping, with the following universal property: For any  $R$ -module  $P$  and any  $R$ -bilinear mapping  $f : M \times N \rightarrow P$ , there exists a unique  $R$ -linear mapping  $\tilde{f} : M \otimes_R N \rightarrow P$  such that  $f = \tilde{f} \circ g$ . In other words, the following diagram commutes:*

$$\begin{array}{ccc} M \times N & \xrightarrow{f} & P \\ & \searrow g & \nearrow \exists! \tilde{f} \\ & M \otimes_R N & \end{array}$$

Then  $M \otimes_R N$  is called the **tensor product** of  $R$ -modules  $M$  and  $N$

*Proof.* We first prove the existence of such  $R$ -module  $T$ . Let  $M, N$  be  $R$ -modules. Let  $T$  be the quotient module  $P/Q$ , where  $P$  is the free  $R$ -module  $R^{(M \times N)}$  and  $Q$  is the  $R$ -module generated by all elements of the following types:  $(x \in M, y \in N)$

$$\begin{aligned} (x + x', y) - (x, y) - (x', y), \\ (x, y + y') - (x, y) - (x, y'), \\ (ax, y) - a(x, y), \\ (x, ay) - a(x, y) \end{aligned}$$

Let  $\pi : M \times N \rightarrow T$  denote the natural map. This map is  $R$ -bilinear, as implied by the above relations when we check the bilinearity conditions. Denote the image  $\pi(x, y) = x \otimes y$ , then these elements generate  $T$ . Now let  $f : M \times N \rightarrow P$  be an  $R$ -bilinear map, then we can define  $f' : T \rightarrow P$  by extending the mapping  $f'(x \otimes y) = f(x, y)$ . Clearly  $f = f' \circ \pi$ . Moreover,  $f'$  is uniquely determined by the value on the generating sets  $\{x \otimes y : x \in M, y \in N\}$ . Suppose there is another pair  $(T', g')$  satisfying the same properties. Then there is a unique  $j : T \rightarrow T'$  and also  $j' : T' \rightarrow T$  such that  $g' = j \circ g$ ,  $g = j' \circ g'$ . But then both the maps  $(j \circ j') \circ g$  and  $g$  satisfies the universal properties, so by uniqueness they are equal, and hence  $j' \circ j$  is identity on  $T$ . Similarly  $(j' \circ j) \circ g' = g'$  and  $j \circ j'$  is identity on  $T'$ . So  $j$  is an isomorphism.  $\square$

**Proposition 1.3.2.** *Let  $R$  be a ring. Let  $M$  and  $N$  be  $R$ -modules.*

- (1) *If  $N$  and  $M$  are finite, then so is  $M \otimes_R N$ .*
- (2) *If  $N$  and  $M$  are finitely presented, then so is  $M \otimes_R N$ .*

*Proof.* Suppose  $M$  is finite. Then choose a presentation  $0 \rightarrow K \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$ . This gives an exact sequence  $K \otimes_R N \rightarrow N^{\oplus n} \rightarrow M \otimes_R N \rightarrow 0$ . We conclude that if  $N$  is finite too then  $M \otimes_R N$  is a quotient of a finite module, hence finite. Similarly, if both  $N$  and  $M$  are finitely presented, then we see that  $K$  is finite and that  $M \otimes_R N$  is a quotient of the finitely presented module  $N^{\oplus n}$  by a finite module, namely  $K \otimes_R N$ , and hence finitely presented.  $\square$

**Proposition 1.3.3.** *Let  $M$  be an  $R$ -module. Then the  $S^{-1}R$ -modules  $S^{-1}M$  and  $S^{-1}R \otimes_R M$  are canonically isomorphic, and the canonical isomorphism  $f : S^{-1}R \otimes_R M \rightarrow S^{-1}M$  is given by*

$$f((a/s) \otimes m) = am/s, \forall a \in R, m \in M, s \in S.$$

*Proof.* Obviously, the map  $f' : S^{-1}R \times M \rightarrow S^{-1}M$  given by  $f'(a/s, m) = am/s$  is bilinear, and thus by the universal property, this map induces a unique  $S^{-1}R$ -module homomorphism  $f : S^{-1}R \otimes_R M \rightarrow S^{-1}M$  as in the statement of the lemma. Actually every element in  $S^{-1}M$  is of the form  $m/s$ ,  $m \in M, s \in S$  and every element in  $S^{-1}R \otimes_R M$  is of the form  $1/s \otimes m$ . To see the latter fact, write an element in  $S^{-1}R \otimes_R M$  as

$$\sum_k \frac{a_k}{s_k} \otimes m_k = \sum_k \frac{a_k t_k}{s} \otimes m_k = \frac{1}{s} \otimes \sum_k a_k t_k m_k = \frac{1}{s} \otimes m.$$

Where  $m = \sum_k a_k t_k m_k$ . Then it is obvious that  $f$  is surjective, and if  $f(\frac{1}{s} \otimes m) = m/s = 0$  then there exists  $t' \in S$  with  $tm = 0$  in  $M$ . Then we have

$$\frac{1}{s} \otimes m = \frac{1}{st} \otimes tm = \frac{1}{st} \otimes 0 = 0.$$

Therefore  $f$  is injective.  $\square$

**Proposition 1.3.4.** *Let  $M, N$  be  $R$ -modules, then there is a canonical  $S^{-1}R$ -module isomorphism  $f : S^{-1}M \otimes_{S^{-1}R} S^{-1}N \rightarrow S^{-1}(M \otimes_R N)$ , given by*

$$f((m/s) \otimes (n/t)) = (m \otimes n)/st.$$

*Proof.* We may use Proposition 1.3.3 repeatedly to see that these two  $S^{-1}R$ -modules are isomorphic, noting that  $S^{-1}R$  is an  $(R, S^{-1}R)$ -bimodule:

$$\begin{aligned} S^{-1}(M \otimes_R N) &\cong S^{-1}R \otimes_R (M \otimes_R N) \\ &\cong S^{-1}M \otimes_R N \\ &\cong (S^{-1}M \otimes_{S^{-1}R} S^{-1}R) \otimes_R N \\ &\cong S^{-1}M \otimes_{S^{-1}R} (S^{-1}R \otimes_R N) \\ &\cong S^{-1}M \otimes_{S^{-1}R} S^{-1}N \end{aligned}$$

This isomorphism is easily seen to be the one stated in the lemma.  $\square$

### 1.3.2 Base-Change Properties

We formally introduce base change in algebra as follows.

**Definition 1.3.5.** *Let  $\varphi : R \rightarrow S$  be a ring map. Let  $M$  be an  $S$ -module. Let  $R \rightarrow R'$  be any ring map. The **base change** of  $\varphi$  by  $R \rightarrow R'$  is the ring map  $R' \rightarrow S \otimes_R R'$ . In this situation we often write  $S' = S \otimes_R R'$ . The **base change** of the  $S$ -module  $M$  is the  $S'$ -module  $M \otimes_R R'$ .*

If  $S = R[x_i]/(f_j)$  for some collection of variables  $x_i$ ,  $i \in I$  and some collection of polynomials  $f_j \in R[x_i]$ ,  $j \in J$ , then  $S \otimes_R R' = R'[x_i]/(f'_j)$ , where  $f'_j \in R'[x_i]$  is the image of  $f_j$  under the map  $R[x_i] \rightarrow R'[x_i]$  induced by  $R \rightarrow R'$ . This simple remark is the key to understanding base change.

**Proposition 1.3.6.** *The finite generatedness/finite presentation of modules and rings are stable under base change.*

*Proof.* Trivial since the tensor product is right exact.  $\square$

**Definition 1.3.7.** *Let  $\varphi : R \rightarrow S$  be a ring map. Given an  $S$ -module  $N$  we obtain an  $R$ -module  $N_R$  by the rule  $r \cdot n = \varphi(r)n$ . This is sometimes called the **restriction** of  $N$  to  $R$ .*

**Proposition 1.3.8.** *Let  $R \rightarrow S$  be a ring map. The functors  $\text{Mod}_S \rightarrow \text{Mod}_R$ ,  $N \mapsto N_R$  (restriction) and  $\text{Mod}_R \rightarrow \text{Mod}_S$ ,  $M \mapsto M \otimes_R S$  (base change) are adjoint functors. In a formula*

$$\text{Hom}_R(M, N_R) = \text{Hom}_S(M \otimes_R S, N)$$

*Proof.* If  $\alpha : M \rightarrow N_R$  is an  $R$ -module map, then we define  $\alpha' : M \otimes_R S \rightarrow N$  by the rule  $\alpha'(m \otimes s) = s\alpha(m)$ . If  $\beta : M \otimes_R S \rightarrow N$  is an  $S$ -module map, we define  $\beta' : M \rightarrow N_R$  by the rule  $\beta'(m) = \beta(m \otimes 1)$ . We omit the verification that these constructions are mutually inverse.  $\square$

The lemma above tells us that restriction has a left adjoint, namely base change. It also has a right adjoint.

**Proposition 1.3.9.** *Let  $R \rightarrow S$  be a ring map. The functors  $\text{Mod}_S \rightarrow \text{Mod}_R$ ,  $N \mapsto N_R$  (restriction) and  $\text{Mod}_R \rightarrow \text{Mod}_S$ ,  $M \mapsto \text{Hom}_R(S, M)$  are adjoint functors. In a formula*

$$\text{Hom}_R(N_R, M) = \text{Hom}_S(N, \text{Hom}_R(S, M))$$

*Proof.* If  $\alpha : N_R \rightarrow M$  is an  $R$ -module map, then we define  $\alpha' : N \rightarrow \text{Hom}_R(S, M)$  by the rule  $\alpha'(n) = (s \mapsto \alpha(sn))$ . If  $\beta : N \rightarrow \text{Hom}_R(S, M)$  is an  $S$ -module map, we define  $\beta' : N_R \rightarrow M$  by the rule  $\beta'(n) = \beta(n)(1)$ . We omit the verification that these constructions are mutually inverse.  $\square$

**Proposition 1.3.10.** *Let  $R \rightarrow S$  be a ring map. Given  $S$ -modules  $M, N$  and an  $R$ -module  $P$  we have*

$$\text{Hom}_R(M \otimes_S N, P) = \text{Hom}_S(M, \text{Hom}_R(N, P))$$

*Proof.* This can be proved directly, but it is also a consequence of Propositions 1.3.8 and 1.3.9. Namely, we have

$$\begin{aligned} \text{Hom}_R(M \otimes_S N, P) &= \text{Hom}_S(M \otimes_S N, \text{Hom}_R(S, P)) \\ &= \text{Hom}_S(M, \text{Hom}_S(N, \text{Hom}_R(S, P))) \\ &= \text{Hom}_S(M, \text{Hom}_R(N, P)) \end{aligned}$$

as desired.  $\square$

### 1.3.3 Flat and Faithfully Modules

**Definition 1.3.11.** *Let  $R$  be a ring.*

1. *An  $R$ -module  $M$  is called **flat** if whenever  $N_1 \rightarrow N_2 \rightarrow N_3$  is an exact sequence of  $R$ -modules the sequence  $M \otimes_R N_1 \rightarrow M \otimes_R N_2 \rightarrow M \otimes_R N_3$  is exact as well.*
2. *An  $R$ -module  $M$  is called **faithfully flat** if the complex of  $R$ -modules  $N_1 \rightarrow N_2 \rightarrow N_3$  is exact if and only if the sequence  $M \otimes_R N_1 \rightarrow M \otimes_R N_2 \rightarrow M \otimes_R N_3$  is exact.*
3. *A ring map  $R \rightarrow S$  is called **flat** if  $S$  is flat as an  $R$ -module.*
4. *A ring map  $R \rightarrow S$  is called **faithfully flat** if  $S$  is faithfully flat as an  $R$ -module.*

Here is an example of how you can use the flatness condition.

**Lemma 1.3.12.** *Let  $R$  be a ring. Let  $I, J \subset R$  be ideals. Let  $M$  be a flat  $R$ -module. Then  $IM \cap JM = (I \cap J)M$ .*

*Proof.* Consider the exact sequence  $0 \rightarrow I \cap J \rightarrow R \rightarrow R/I \oplus R/J$ . Tensoring with the flat module  $M$  we obtain an exact sequence

$$0 \rightarrow (I \cap J) \otimes_R M \rightarrow M \rightarrow M/IM \oplus M/JM$$

Since the kernel of  $M \rightarrow M/IM \oplus M/JM$  is equal to  $IM \cap JM$  we conclude.  $\square$

**Proposition 1.3.13.** *Let  $R$  be a ring. Let  $\{M_i, \varphi_{ii'}\}$  be a directed system of flat  $R$ -modules. Then  $\varinjlim_i M_i$  is a flat  $R$ -module.*

*Proof.* This follows as  $\otimes$  commutes with colimits and because directed colimits are exact.  $\square$

**Proposition 1.3.14.** *A composition of (faithfully) flat ring maps is (faithfully) flat. If  $R \rightarrow R'$  is (faithfully) flat, and  $M'$  is a (faithfully) flat  $R'$ -module, then  $M'$  is a (faithfully) flat  $R$ -module.*

*Proof.* The first statement of the lemma is a particular case of the second, so it is clearly enough to prove the latter. Let  $R \rightarrow R'$  be a flat ring map, and  $M'$  a flat  $R'$ -module. We need to prove that  $M'$  is a flat  $R$ -module. Let  $N_1 \rightarrow N_2 \rightarrow N_3$  be an exact complex of  $R$ -modules. Then, the complex  $R' \otimes_R N_1 \rightarrow R' \otimes_R N_2 \rightarrow R' \otimes_R N_3$  is exact (since  $R'$  is flat as an  $R$ -module), and so the complex  $M' \otimes_{R'} (R' \otimes_R N_1) \rightarrow M' \otimes_{R'} (R' \otimes_R N_2) \rightarrow M' \otimes_{R'} (R' \otimes_R N_3)$  is exact (since  $M'$  is a flat  $R'$ -module). Since  $M' \otimes_{R'} (R' \otimes_R N) \cong (M' \otimes_{R'} R') \otimes_R N \cong M' \otimes_R N$  for any  $R$ -module  $N$  functorially, this complex is isomorphic to the complex  $M' \otimes_R N_1 \rightarrow M' \otimes_R N_2 \rightarrow M' \otimes_R N_3$ , which is therefore also exact. This shows that  $M'$  is a flat  $R$ -module. Tracing this argument backwards, we can show that if  $R \rightarrow R'$  is faithfully flat, and if  $M'$  is faithfully flat as an  $R'$ -module, then  $M'$  is faithfully flat as an  $R$ -module.  $\square$

**Proposition 1.3.15.** *Let  $M$  be an  $R$ -module. The following are equivalent:*

1.  $M$  is flat over  $R$ .
2. for every injection of  $R$ -modules  $N \subset N'$  the map  $N \otimes_R M \rightarrow N' \otimes_R M$  is injective.
3. for every ideal  $I \subset R$  the map  $I \otimes_R M \rightarrow R \otimes_R M = M$  is injective.
4. for every finitely generated ideal  $I \subset R$  the map  $I \otimes_R M \rightarrow R \otimes_R M = M$  is injective.

*Proof.* We prove (4) implies (1). Suppose that  $N_1 \rightarrow N_2 \rightarrow N_3$  is exact. Let  $K = \ker(N_2 \rightarrow N_3)$  and  $Q = \operatorname{Im}(N_2 \rightarrow N_3)$ . Then we get maps

$$N_1 \otimes_R M \rightarrow K \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow Q \otimes_R M \rightarrow N_3 \otimes_R M$$

Observe that the first and third arrows are surjective. Thus if we show that the second and fourth arrows are injective, then we are done by some chase. Hence it suffices to show that  $- \otimes_R M$  transforms injective  $R$ -module maps into injective  $R$ -module maps.

Assume  $K \rightarrow N$  is an injective  $R$ -module map and let  $x \in \ker(K \otimes_R M \rightarrow N \otimes_R M)$ . We have to show that  $x$  is zero. The  $R$ -module  $K$  is the union of its finite  $R$ -submodules; hence,  $K \otimes_R M$  is the colimit of  $R$ -modules of the form  $K_i \otimes_R M$  where  $K_i$  runs over all finite  $R$ -submodules of  $K$  (because tensor product commutes with colimits). Thus, for some  $i$  our  $x$  comes from an element  $x_i \in K_i \otimes_R M$ . Thus we may assume that  $K$  is a finite  $R$ -module. Assume this. We regard the injection  $K \rightarrow N$  as an inclusion, so that  $K \subset N$ .

The  $R$ -module  $N$  is the union of its finite  $R$ -submodules that contain  $K$ . Hence,  $N \otimes_R M$  is the colimit of  $R$ -modules of the form  $N_i \otimes_R M$  where  $N_i$  runs over all finite  $R$ -submodules of  $N$  that contain  $K$  (again since tensor product commutes with colimits). Notice that this is a colimit over a directed system (since the sum of two finite submodules of  $N$  is again finite). Hence, the element  $x \in K \otimes_R M$  maps to zero in at least one of these  $R$ -modules  $N_i \otimes_R M$  (since  $x$  maps to zero in  $N \otimes_R M$ ). Thus we may assume  $N$  is a finite  $R$ -module.

Assume  $N$  is a finite  $R$ -module. Write  $N = R^{\oplus n}/L$  and  $K = L'/L$  for some  $L \subset L' \subset R^{\oplus n}$ . For any  $R$ -submodule  $G \subset R^{\oplus n}$ , we have a canonical map  $G \otimes_R M \rightarrow M^{\oplus n}$  obtained by composing  $G \otimes_R M \rightarrow R^n \otimes_R M = M^{\oplus n}$ . It suffices to prove that  $L \otimes_R M \rightarrow M^{\oplus n}$  and  $L' \otimes_R M \rightarrow M^{\oplus n}$  are injective. Namely, if so, then we see that  $K \otimes_R M = L' \otimes_R M / L \otimes_R M \rightarrow M^{\oplus n} / L \otimes_R M$  is injective too.

Thus it suffices to show that  $L \otimes_R M \rightarrow M^{\oplus n}$  is injective when  $L \subset R^{\oplus n}$  is an  $R$ -submodule. We do this by induction on  $n$ . The base case  $n = 1$  we handle below. For the induction step assume  $n > 1$  and set  $L' = L \cap R \oplus 0^{\oplus n-1}$ . Then  $L'' = L/L'$  is a submodule of  $R^{\oplus n-1}$ . We obtain a diagram

$$\begin{array}{ccccccc} L' \otimes_R M & \longrightarrow & L \otimes_R M & \longrightarrow & L'' \otimes_R M & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & M & \longrightarrow & M^{\oplus n} & \longrightarrow & M^{\oplus n-1} \longrightarrow 0 \end{array}$$

By induction hypothesis and the base case the left and right vertical arrows are injective. The rows are exact. It follows that the middle vertical arrow is injective too.

The base case of the induction above is when  $L \subset R$  is an ideal. In other words, we have to show that  $I \otimes_R M \rightarrow M$  is injective for any ideal  $I$  of  $R$ . We know this is true when  $I$  is finitely generated. However,  $I = \bigcup I_\alpha$  is the union of the finitely generated

ideals  $I_\alpha$  contained in it. In other words,  $I = \varinjlim I_\alpha$ . Since  $\otimes$  commutes with colimits we see that  $I \otimes_R M = \varinjlim I_\alpha \otimes_R M$  and since all the morphisms  $I_\alpha \otimes_R M \rightarrow M$  are injective by assumption, the same is true for  $I \otimes_R M \rightarrow M$ .  $\square$

**Proposition 1.3.16.** *Let  $\{R_i, \varphi_{ii'}\}$  be a system of rings over the directed set  $I$ . Let  $R = \varinjlim_i R_i$ .*

1. *If  $M$  is an  $R$ -module such that  $M$  is flat as an  $R_i$ -module for all  $i$ , then  $M$  is flat as an  $R$ -module.*
2. *For  $i \in I$  let  $M_i$  be a flat  $R_i$ -module and for  $i' \geq i$  let  $f_{ii'} : M_i \rightarrow M_{i'}$  be a  $\varphi_{ii'}$ -linear map such that  $f_{i'i''} \circ f_{ii'} = f_{ii''}$ . Then  $M = \varinjlim_{i \in I} M_i$  is a flat  $R$ -module.*

*Proof.* Part (1) is a special case of part (2) with  $M_i = M$  for all  $i$  and  $f_{ii'} = \text{id}_M$ . Proof of (2). Let  $\mathfrak{a} \subset R$  be a finitely generated ideal. By Lemma 1.3.15 it suffices to show that  $\mathfrak{a} \otimes_R M \rightarrow M$  is injective. We can find an  $i \in I$  and a finitely generated ideal  $\mathfrak{a}' \subset R_i$  such that  $\mathfrak{a} = \mathfrak{a}'R$ . Then  $\mathfrak{a} = \varinjlim_{i' \geq i} \mathfrak{a}'R_{i'}$ . Since  $\otimes$  commutes with colimits the map  $\mathfrak{a} \otimes_R M \rightarrow M$  is the colimit of the maps

$$\mathfrak{a}'R_{i'} \otimes_{R_{i'}} M_{i'} \longrightarrow M_{i'}$$

These maps are all injective by assumption. Since colimits over  $I$  are exact, we win.  $\square$

**Proposition 1.3.17.** *Let  $R$  be a ring.*

1. *Suppose that  $M$  is (faithfully) flat over  $R$ , and that  $R \rightarrow R'$  is a ring map. Then  $M \otimes_R R'$  is (faithfully) flat over  $R'$ .*
2. *Let  $R \rightarrow R'$  be a faithfully flat ring map. Let  $M$  be a module over  $R$ , and set  $M' = R' \otimes_R M$ . Then  $M$  is flat over  $R$  if and only if  $M'$  is flat over  $R'$ .*
3. *Let  $R$  be a ring. Let  $S \rightarrow S'$  be a flat map of  $R$ -algebras. Let  $M$  be a module over  $S$ , and set  $M' = S' \otimes_S M$ . Then If  $M$  is flat over  $R$ , then  $M'$  is flat over  $R$ . If  $S \rightarrow S'$  is faithfully flat, then  $M$  is flat over  $R$  if and only if  $M'$  is flat over  $R$ .*
4. *Let  $R \rightarrow S$  be a ring map. Let  $M$  be an  $S$ -module. If  $M$  is flat as an  $R$ -module and faithfully flat as an  $S$ -module, then  $R \rightarrow S$  is flat.*

*Proof.* (1) is trivial and we consider (2).

By (1) we see that if  $M$  is flat then  $M'$  is flat. For the converse, suppose that  $M'$  is flat. Let  $N_1 \rightarrow N_2 \rightarrow N_3$  be an exact sequence of  $R$ -modules. We want to show that  $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$  is exact. We know that  $N_1 \otimes_R R' \rightarrow N_2 \otimes_R R' \rightarrow N_3 \otimes_R R'$  is exact, because  $R \rightarrow R'$  is flat. Flatness of  $M'$  implies that  $N_1 \otimes_R R' \otimes_{R'} M' \rightarrow N_2 \otimes_R R' \otimes_{R'} M' \rightarrow N_3 \otimes_R R' \otimes_{R'} M'$  is exact. We may write this

as  $N_1 \otimes_R M \otimes_R R' \rightarrow N_2 \otimes_R M \otimes_R R' \rightarrow N_3 \otimes_R M \otimes_R R'$ . Finally, faithful flatness implies that  $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$  is exact.

For (3), let  $N \rightarrow N'$  be an injection of  $R$ -modules. By the flatness of  $S \rightarrow S'$  we have

$$\ker(N \otimes_R M \rightarrow N' \otimes_R M) \otimes_S S' = \ker(N \otimes_R M' \rightarrow N' \otimes_R M')$$

If  $M$  is flat over  $R$ , then the left hand side is zero and we find that  $M'$  is flat over  $R$  by the second characterization of flatness in Lemma 1.3.15. If  $M'$  is flat over  $R$  then we have the vanishing of the right hand side and if in addition  $S \rightarrow S'$  is faithfully flat, this implies that  $\ker(N \otimes_R M \rightarrow N' \otimes_R M)$  is zero which in turn shows that  $M$  is flat over  $R$ .

For (4), let  $N_1 \rightarrow N_2 \rightarrow N_3$  be an exact sequence of  $R$ -modules. By assumption  $N_1 \otimes_R M \rightarrow N_2 \otimes_R M \rightarrow N_3 \otimes_R M$  is exact. We may write this as

$$N_1 \otimes_R S \otimes_S M \rightarrow N_2 \otimes_R S \otimes_S M \rightarrow N_3 \otimes_R S \otimes_S M.$$

By faithful flatness of  $M$  over  $S$  we conclude that  $N_1 \otimes_R S \rightarrow N_2 \otimes_R S \rightarrow N_3 \otimes_R S$  is exact. Hence  $R \rightarrow S$  is flat.  $\square$

**Proposition 1.3.18** (Equational criterion of flatness). *Let  $R$  be a ring. Let  $M$  be an  $R$ -module. Let  $\sum f_i x_i = 0$  be a relation in  $M$ . We say the relation  $\sum f_i x_i$  is trivial if there exist an integer  $m \geq 0$ , elements  $y_j \in M$ ,  $j = 1, \dots, m$ , and elements  $a_{ij} \in R$ ,  $i = 1, \dots, n$ ,  $j = 1, \dots, m$  such that*

$$x_i = \sum_j a_{ij} y_j, \forall i, \quad \text{and} \quad 0 = \sum_i f_i a_{ij}, \forall j.$$

*Then  $M$  is flat over  $R$  if and only if every relation in  $M$  is trivial.*

*Proof.* Assume  $M$  is flat and let  $\sum f_i x_i = 0$  be a relation in  $M$ . Let  $I = (f_1, \dots, f_n)$ , and let  $K = \ker(R^n \rightarrow I, (a_1, \dots, a_n) \mapsto \sum_i a_i f_i)$ . So we have the short exact sequence  $0 \rightarrow K \rightarrow R^n \rightarrow I \rightarrow 0$ . Then  $\sum f_i \otimes x_i$  is an element of  $I \otimes_R M$  which maps to zero in  $R \otimes_R M = M$ . By flatness  $\sum f_i \otimes x_i$  is zero in  $I \otimes_R M$ . Thus there exists an element of  $K \otimes_R M$  mapping to  $\sum e_i \otimes x_i \in R^n \otimes_R M$  where  $e_i$  is the  $i$ th basis element of  $R^n$ . Write this element as  $\sum k_j \otimes y_j$  and then write the image of  $k_j$  in  $R^n$  as  $\sum a_{ij} e_i$  to get the result.

Assume every relation is trivial, let  $I$  be a finitely generated ideal, and let  $x = \sum f_i \otimes x_i$  be an element of  $I \otimes_R M$  mapping to zero in  $R \otimes_R M = M$ . This just means exactly that  $\sum f_i x_i$  is a relation in  $M$ . And the fact that it is trivial implies easily that  $x$  is zero, because

$$x = \sum f_i \otimes x_i = \sum f_i \otimes \left( \sum_j a_{ij} y_j \right) = \sum \left( \sum_i f_i a_{ij} \right) \otimes y_j = 0$$

Well done.  $\square$

**Proposition 1.3.19.** *Suppose that  $R$  is a ring.*

1. *Let  $0 \rightarrow M'' \rightarrow M' \rightarrow M \rightarrow 0$  be a short exact sequence, and  $N$  an  $R$ -module. If  $M$  is flat then  $N \otimes_R M'' \rightarrow N \otimes_R M'$  is injective, i.e., the sequence*

$$0 \rightarrow N \otimes_R M'' \rightarrow N \otimes_R M' \rightarrow N \otimes_R M \rightarrow 0$$

*is a short exact sequence.*

2. *Suppose that  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$  is a short exact sequence of  $R$ -modules. If  $M'$  and  $M''$  are flat so is  $M$ . If  $M$  and  $M''$  are flat so is  $M'$ .*

*Proof.* For (1), let  $R^{(I)} \rightarrow N$  be a surjection from a free module onto  $N$  with kernel  $K$ . The result follows from the snake lemma applied to the following diagram

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M'' \otimes_R N & \longrightarrow & M' \otimes_R N & \longrightarrow & M \otimes_R N \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 0 & \longrightarrow & (M'')^{(I)} & \longrightarrow & (M')^{(I)} & \longrightarrow & M^{(I)} \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M'' \otimes_R K & \longrightarrow & M' \otimes_R K & \longrightarrow & M \otimes_R K \longrightarrow 0 \\
 & & & & & & \uparrow \\
 & & & & & & 0
 \end{array}$$

with exact rows and columns. The middle row is exact because tensoring with the free module  $R^{(I)}$  is exact.

For (2), we will use the criterion that a module  $N$  is flat if for every ideal  $I \subset R$  the map  $N \otimes_R I \rightarrow N$  is injective, see Lemma 1.3.15. Consider an ideal  $I \subset R$ . Consider the diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & M' & \longrightarrow & M & \longrightarrow & M'' \longrightarrow 0 \\
 & & \uparrow & & \uparrow & & \uparrow \\
 & & M' \otimes_R I & \longrightarrow & M \otimes_R I & \longrightarrow & M'' \otimes_R I \longrightarrow 0
 \end{array}$$

with exact rows. This immediately proves the first assertion. The second follows because if  $M''$  is flat then the lower left horizontal arrow is injective by (1).  $\square$

### 1.3.4 More Faithfully Flatness

## 1.4 Some Radicals

### 1.4.1 Radical of Rings

**Definition 1.4.1.** For any ideal  $I \subset R$ , define  $\sqrt{I} := \{x \in R : x^n \in I \text{ for some } n\}$ .

**Proposition 1.4.2.** For any ideal  $I \subset R$ , we have

$$\sqrt{I} = \bigcap_{I \subset \mathfrak{p}, \mathfrak{p} \text{ prime}} \mathfrak{p}.$$

*Proof.* The inclusion  $\sqrt{I} \subset \bigcap_{I \subset \mathfrak{p}, \mathfrak{p} \text{ prime}} \mathfrak{p}$  is trivial by definitions.

Conversely, take  $g \in R \setminus \sqrt{I}$ , then  $g^n \notin I$  for any  $n$ . Let  $\bar{\mathfrak{p}} \subset R_g$  be a prime such that  $IR_g \subset \bar{\mathfrak{p}} \subset R_g$ . Take  $\mathfrak{p} \subset R$  be the inverse image of  $\bar{\mathfrak{p}}$ , then  $I \subset \mathfrak{p}$  but  $\mathfrak{p} \cap \{1, g, g^2, \dots\} = \emptyset$ . Well done.  $\square$

### 1.4.2 Jacobson Radical and Nilradical of Rings

**Definition 1.4.3.** Let  $R$  be a ring.

(1) The Jacobson radical of a ring  $R$  is

$$\text{rad}(R) = \bigcap_{\mathfrak{m}, \mathfrak{m} \text{ maximal}} \mathfrak{m}.$$

(2) The nilradical of a ring  $R$  is

$$\text{nil}(R) = \sqrt{0} = \bigcap_{\mathfrak{p}, \mathfrak{p} \text{ prime}} \mathfrak{p}.$$

**Proposition 1.4.4.** Let  $R$  be a ring with Jacobson radical  $\text{rad}(R)$ . Let  $I \subset R$  be an ideal. The following are equivalent

1.  $I \subset \text{rad}(R)$ , and
2. every element of  $1 + I$  is a unit in  $R$ .

In this case every element of  $R$  which maps to a unit of  $R/I$  is a unit.

*Proof.* If  $f \in \text{rad}(R)$ , then  $f \in \mathfrak{m}$  for all maximal ideals  $\mathfrak{m}$  of  $R$ . Hence  $1 + f \notin \mathfrak{m}$  for all maximal ideals  $\mathfrak{m}$  of  $R$ . Thus the closed subset  $V(1 + f)$  of  $\text{Spec}(R)$  is empty. This implies that  $1 + f$  is a unit.

Conversely, assume that  $1 + f$  is a unit for all  $f \in I$ . If  $\mathfrak{m}$  is a maximal ideal and  $I \not\subset \mathfrak{m}$ , then  $I + \mathfrak{m} = R$ . Hence  $1 = f + g$  for some  $g \in \mathfrak{m}$  and  $f \in I$ . Then  $g = 1 + (-f)$  is not a unit, contradiction.

For the final statement let  $f \in R$  map to a unit in  $R/I$ . Then we can find  $g \in R$  mapping to the multiplicative inverse of  $f \bmod I$ . Then  $fg = 1 \bmod I$ . Hence  $fg$  is a unit of  $R$  by (2) which implies that  $f$  is a unit.  $\square$

**Lemma 1.4.5.** *Let  $\varphi : R \rightarrow S$  be a ring map such that the induced map  $\text{Spec}(S) \rightarrow \text{Spec}(R)$  is surjective. Then an element  $x \in R$  is a unit if and only if  $\varphi(x) \in S$  is a unit.*

*Proof.* If  $x$  is a unit, then so is  $\varphi(x)$ . Conversely, if  $\varphi(x)$  is a unit, then  $\varphi(x) \notin \mathfrak{q}$  for all  $\mathfrak{q} \in \text{Spec}(S)$ . Hence  $x \notin \varphi^{-1}(\mathfrak{q}) = \text{Spec}(\varphi)(\mathfrak{q})$  for all  $\mathfrak{q} \in \text{Spec}(S)$ . Since  $\text{Spec}(\varphi)$  is surjective we conclude that  $x$  is a unit.  $\square$

## 1.5 Prime Ideals, some Interesting Things

### 1.5.1 Prime Avoidance

This is an easy but important result.

**Lemma 1.5.1.** *Let  $R$  be a ring,  $I$  and  $J$  two ideals and  $\mathfrak{p}$  a prime ideal containing the product  $IJ$ . Then  $\mathfrak{p}$  contains  $I$  or  $J$ .*

*Proof.* Assume the contrary and take  $x \in I \setminus \mathfrak{p}$  and  $y \in J \setminus \mathfrak{p}$ . Their product is an element of  $IJ \subset \mathfrak{p}$ , which contradicts the assumption that  $\mathfrak{p}$  was prime.  $\square$

**Proposition 1.5.2** (Prime Avoidance). *Let  $R$  be a ring. Let  $I_i \subset R$ ,  $i = 1, \dots, r$ , and  $J \subset R$  be ideals. Assume*

1.  $J \not\subset I_i$  for  $i = 1, \dots, r$ , and
2. all but two of  $I_i$  are prime ideals.

*Then there exists an  $x \in J$ ,  $x \notin I_i$  for all  $i$ .*

*Proof.* The result is true for  $r = 1$ . If  $r = 2$ , then let  $x, y \in J$  with  $x \notin I_1$  and  $y \notin I_2$ . We are done unless  $x \in I_2$  and  $y \in I_1$ . Then the element  $x + y$  cannot be in  $I_1$  (since that would mean  $x + y - y \in I_1$ ) and it also cannot be in  $I_2$ .

For  $r \geq 3$ , assume the result holds for  $r - 1$ . After renumbering we may assume that  $I_r$  is prime. We may also assume there are no inclusions among the  $I_i$ . Pick  $x \in J$ ,  $x \notin I_i$  for all  $i = 1, \dots, r - 1$ . If  $x \notin I_r$  we are done. So assume  $x \in I_r$ . If  $J I_1 \dots I_{r-1} \subset I_r$  then  $J \subset I_r$  (by Lemma 1.5.1) a contradiction. Pick  $y \in J I_1 \dots I_{r-1}$ ,  $y \notin I_r$ . Then  $x + y$  works.  $\square$

### 1.5.2 Oka Families and Its Applications

Here we introduce a very interesting thing.

**Definition 1.5.3.** Let  $R$  be a ring. If  $I$  is an ideal of  $R$  and  $a \in R$ , we define

$$(I : a) = \{x \in R : xa \in I\}.$$

More generally, if  $J \subset R$  is an ideal, we define

$$(I : J) = \{x \in R : xJ \subset I\}.$$

**Definition 1.5.4** (Oka Family). Let  $R$  be a ring. Let  $\mathcal{F}$  be a set of ideals of  $R$ . We say  $\mathcal{F}$  is an *Oka family* if  $R \in \mathcal{F}$  and whenever  $I \subset R$  is an ideal and  $(I : a), (I, a) \in \mathcal{F}$  for some  $a \in R$ , then  $I \in \mathcal{F}$ .

Here is the fundamental property of Oka family:

**Proposition 1.5.5.** If  $\mathcal{F}$  is an Oka family of ideals, then any maximal element of the complement of  $\mathcal{F}$  is prime.

*Proof.* Suppose  $I \notin \mathcal{F}$  is maximal with respect to not being in  $\mathcal{F}$  but  $I$  is not prime. Note that  $I \neq R$  because  $R \in \mathcal{F}$ . Since  $I$  is not prime we can find  $a, b \in R - I$  with  $ab \in I$ . It follows that  $(I, a) \neq I$  and  $(I : a)$  contains  $b \notin I$  so also  $(I : a) \neq I$ . Thus  $(I : a), (I, a)$  both strictly contain  $I$ , so they must belong to  $\mathcal{F}$ . By the Oka condition, we have  $I \in \mathcal{F}$ , a contradiction.  $\square$

Now we discover some special Oka families which will induce many interesting results! Before that, we introduce a lemma:

**Lemma 1.5.6.** Let  $R$  be a ring. For a principal ideal  $J \subset R$ , and for any ideal  $I \subset R$  we have  $I = J(I : J)$ .

*Proof.* Say  $J = (a)$ . Then  $(I : J) = (I : a)$ . Since  $I \subset J$  we see that any  $y \in I$  is of the form  $y = xa$  for some  $x \in (I : a)$ . Hence  $I \subset J(I : J)$ . Conversely, if  $x \in (I : a)$ , then  $xJ = (xa) \subset I$ , which proves the other inclusion.  $\square$

**Corollary 1.5.7.** Let  $R$  be a ring and let  $S$  be a multiplicative subset of  $R$ .

- (1) The family  $\mathcal{F} = \{I \subset R \mid I \cap S \neq \emptyset\}$  is an Oka family.
- (2) An ideal  $I \subset R$  which is maximal with respect to the property that  $I \cap S = \emptyset$  is prime.

In particular, we have the following things.

- (3) An ideal maximal among the ideals which do not contain a nonzerodivisor is prime.

- (4) If  $R$  is nonzero and every nonzero prime ideal in  $R$  contains a nonzerodivisor, then  $R$  is a domain.

*Proof.* For (1), suppose that  $(I : a), (I, a) \in \mathcal{F}$  for some  $a \in R$ . Then pick  $s \in (I, a) \cap S$  and  $s' \in (I : a) \cap S$ . Then  $ss' \in I \cap S$  and hence  $I \in \mathcal{F}$ . Thus  $\mathcal{F}$  is an Oka family.

For (2), this follows directly from (1) and Proposition 1.5.5.

For (3), consider the set  $S$  of nonzerodivisors. It is a multiplicative subset of  $R$ . Hence any ideal maximal with respect to not intersecting  $S$  is prime by (1).

Thus for (4), if every nonzero prime ideal contains a nonzerodivisor, then (0) is prime, i.e.,  $R$  is a domain.  $\square$

**Corollary 1.5.8.** *Let  $R$  be a ring.*

- (1) *The family of finitely generated ideals is an Oka family.*
- (2) *An ideal  $I \subset R$  maximal with respect to not being finitely generated is prime.*
- (3) *If every prime ideal of  $R$  is finitely generated, then every ideal of  $R$  is finitely generated, that is,  $R$  is Noetherian.*

*Proof.* For (1), Let  $I \subset R$  an ideal, and  $a \in R$ . If  $(I : a)$  is generated by  $a_1, \dots, a_n$  and  $(I, a)$  is generated by  $a, b_1, \dots, b_m$  with  $b_1, \dots, b_m \in I$ , we claim that  $I$  is generated by  $aa_1, \dots, aa_n, b_1, \dots, b_m$ .

Indeed, note that if  $x \in I$ , then  $x \in (I, a)$  is a linear combination of  $a, b_1, \dots, b_m$ , but the coefficient of  $a$  must lie in  $(I : a)$ . As a result, we deduce that the family of finitely generated ideals is an Oka family.

For (2), this is an immediate consequence of (1) and Proposition 1.5.5.

For (3), suppose that there exists an ideal  $I \subset R$  which is not finitely generated. The union of a totally ordered chain  $\{I_\alpha\}$  of ideals that are not finitely generated is not finitely generated; indeed, if  $I = \bigcup I_\alpha$  were generated by  $a_1, \dots, a_n$ , then all the generators would belong to some  $I_\alpha$  and would consequently generate it. By Zorn's lemma, there is an ideal maximal with respect to being not finitely generated. By (2) this ideal is prime.  $\square$

**Corollary 1.5.9.** *Let  $R$  be a ring.*

- (1) *The family of principal ideals of  $R$  is an Oka family.*
- (2) *An ideal  $I \subset R$  maximal with respect to not being principal is prime.*
- (3) *If every prime ideal of  $R$  is principal, then every ideal of  $R$  is principal.*

*Proof.* For (1), suppose  $I \subset R$  is an ideal,  $a \in R$ , and  $(I, a)$  and  $(I : a)$  are principal. Note that  $(I : a) = (I : (I, a))$ . Setting  $J = (I, a)$ , we find that  $J$  is principal and  $(I : J)$  is too. By Lemma 1.5.6 we have  $I = J(I : J)$ . Thus we find in our situation that since  $J = (I, a)$  and  $(I : J)$  are principal,  $I$  is principal.

For (2), this follows from (1) and Proposition 1.5.5.

For (3), suppose that there exists an ideal  $I \subset R$  which is not principal. The union of a totally ordered chain  $\{I_\alpha\}$  of ideals that not principal is not principal; indeed, if  $I = \bigcup I_\alpha$  were generated by  $a$ , then  $a$  would belong to some  $I_\alpha$  and  $a$  would generate it. By Zorn's lemma, there is an ideal maximal with respect to not being principal. This ideal is necessarily prime by (2).  $\square$

**Corollary 1.5.10.** *Let  $A$  be a ring,  $I \subset A$  an ideal, and  $a \in A$  an element. Let  $P$  is a property of  $A$ -modules that is stable under extensions and holds for 0.*

- (1) *The family of ideals  $I$  such that  $A/I$  has  $P$  is an Oka family.*
- (2) *The ideal maximal such that  $P$  does not holds is prime.*

*Proof.* For (1), there is a short exact sequence  $0 \rightarrow A/(I : a) \rightarrow A/I \rightarrow A/(I, a) \rightarrow 0$  where the first arrow is given by multiplication by  $a$ . Thus if  $P$  is a property of  $A$ -modules that is stable under extensions and holds for 0, then the family of ideals  $I$  such that  $A/I$  has  $P$  is an Oka family.

For (2), this follows from (1) and Proposition 1.5.5.  $\square$

## 1.6 Cayley-Hamilton

Here we introduce Cayley-Hamilton theorem of general rings and its applications.

**Proposition 1.6.1** (Cayley-Hamilton). *Let  $R$  be a ring. Let  $A = (a_{ij})$  be an  $n \times n$  matrix with coefficients in  $R$ . Let  $P(x) \in R[x]$  be the characteristic polynomial of  $A$  (defined as  $\det(x \text{id}_{n \times n} - A)$ ). Then  $P(A) = 0$  in  $\text{Mat}(n \times n, R)$ .*

*Proof.* We reduce the question to the well-known Cayley-Hamilton theorem from linear algebra in several steps:

1. If  $\phi : S \rightarrow R$  is a ring morphism and  $b_{ij}$  are inverse images of the  $a_{ij}$  under this map, then it suffices to show the statement for  $S$  and  $(b_{ij})$  since  $\phi$  is a ring morphism.
2. If  $\psi : R \hookrightarrow S$  is an injective ring morphism, it clearly suffices to show the result for  $S$  and the  $a_{ij}$  considered as elements of  $S$ .
3. Thus we may first reduce to the case  $R = \mathbb{Z}[X_{ij}]$ ,  $a_{ij} = X_{ij}$  of a polynomial ring and then further to the case  $R = \mathbb{Q}(X_{ij})$  where we may finally apply Cayley-Hamilton.

Then well done.  $\square$

**Corollary 1.6.2.** *Let  $R$  be a ring. Let  $M$  be a finite  $R$ -module. Let  $\varphi : M \rightarrow M$  be an endomorphism. Then there exists a monic polynomial  $P \in R[T]$  such that  $P(\varphi) = 0$  as an endomorphism of  $M$ .*

*Proof.* Consider

$$\begin{array}{ccc} R^{\oplus n} & \longrightarrow & M \\ A \downarrow & & \downarrow \varphi \\ R^{\oplus n} & \longrightarrow & M \end{array}$$

By Proposition 1.6.1 there exists a monic polynomial  $P$  such that  $P(A) = 0$ . Then it follows that  $P(\varphi) = 0$ .  $\square$

**Corollary 1.6.3.** *Let  $R$  be a ring. Let  $I \subset R$  be an ideal. Let  $M$  be a finite  $R$ -module. Let  $\varphi : M \rightarrow M$  be an endomorphism such that  $\varphi(M) \subset IM$ . Then there exists a monic polynomial  $P = t^n + a_1 t^{n-1} + \dots + a_n \in R[T]$  such that  $a_j \in I^j$  and  $P(\varphi) = 0$  as an endomorphism of  $M$ .*

*Proof.* Consider again

$$\begin{array}{ccc} R^{\oplus n} & \longrightarrow & M \\ A \downarrow & & \downarrow \varphi \\ I^{\oplus n} & \longrightarrow & M \end{array}$$

By Proposition 1.6.1 the polynomial  $P(t) = \det(\text{id}_{n \times n} - A)$  has all the desired properties.  $\square$

As a fun example application we prove the following surprising property.

**Corollary 1.6.4.** *Let  $R$  be a ring. Let  $M$  be a finite  $R$ -module. Let  $\varphi : M \rightarrow M$  be a surjective  $R$ -module map. Then  $\varphi$  is an isomorphism.*

*Proof.* Write  $R' = R[x]$  and think of  $M$  as a finite  $R'$ -module with  $x$  acting via  $\varphi$ . Set  $I = (x) \subset R'$ . By our assumption that  $\varphi$  is surjective we have  $IM = M$ . Hence we may apply Corollary 1.6.3 to  $M$  as an  $R'$ -module, the ideal  $I$  and the endomorphism  $\text{id}_M$ . We conclude that  $(1 + a_1 + \dots + a_n)\text{id}_M = 0$  with  $a_j \in I$ . Write  $a_j = b_j(x)x$  for some  $b_j(x) \in R[x]$ . Translating back into  $\varphi$  we see that  $\text{id}_M = -(\sum_{j=1, \dots, n} b_j(\varphi))\varphi$ , and hence  $\varphi$  is invertible.  $\square$

## 1.7 Nakayama's Lemma

First we recall a lemma:

**Lemma 1.7.1.** *Let  $R$  be a ring. Let  $n \geq m$ . Let  $A$  be an  $n \times m$  matrix with coefficients in  $R$ . Let  $J \subset R$  be the ideal generated by the  $m \times m$  minors of  $A$ .*

1. For any  $f \in J$  there exists a  $m \times n$  matrix  $B$  such that  $BA = f1_{m \times m}$ .
2. If  $f \in R$  and  $BA = f1_{m \times m}$  for some  $m \times n$  matrix  $B$ , then  $f^m \in J$ .

*Proof.* For  $I \subset \{1, \dots, n\}$  with  $|I| = m$ , we denote by  $E_I$  the  $m \times n$  matrix of the projection

$$R^{\oplus n} = \bigoplus_{i \in \{1, \dots, n\}} R \longrightarrow \bigoplus_{i \in I} R$$

and set  $A_I = E_I A$ , i.e.,  $A_I$  is the  $m \times m$  matrix whose rows are the rows of  $A$  with indices in  $I$ . Let  $B_I$  be the adjugate (transpose of cofactor) matrix to  $A_I$ , i.e., such that  $A_I B_I = B_I A_I = \det(A_I) 1_{m \times m}$ . The  $m \times m$  minors of  $A$  are the determinants  $\det A_I$  for all the  $I \subset \{1, \dots, n\}$  with  $|I| = m$ . If  $f \in J$  then we can write  $f = \sum c_I \det(A_I)$  for some  $c_I \in R$ . Set  $B = \sum c_I B_I E_I$  to see that (1) holds.

If  $f1_{m \times m} = BA$  then by the Cauchy-Binet formula we have  $f^m = \sum b_I \det(A_I)$  where  $b_I$  is the determinant of the  $m \times m$  matrix whose columns are the columns of  $B$  with indices in  $I$ .  $\square$

**Theorem 1.7.2** (Nakayama's lemma). *Let  $R$  be a ring with Jacobson radical  $\text{rad}(R)$ . Let  $M$  be an  $R$ -module. Let  $I \subset R$  be an ideal.*

- (1) *If  $IM = M$  and  $M$  is finite, then there exists an  $f \in 1 + I$  such that  $fM = 0$ .*
- (2) *If  $IM = M$ ,  $M$  is finite, and  $I \subset \text{rad}(R)$ , then  $M = 0$ .*
- (3) *If  $N, N' \subset M$ ,  $M = N + IN'$ , and  $N'$  is finite, then there exists an  $f \in 1 + I$  such that  $fM \subset N$  and  $M_f = N_f$ .*
- (4) *If  $N, N' \subset M$ ,  $M = N + IN'$ ,  $N'$  is finite, and  $I \subset \text{rad}(R)$ , then  $M = N$ .*
- (5) *If  $N \rightarrow M$  is a module map,  $N/IN \rightarrow M/IM$  is surjective, and  $M$  is finite, then there exists an  $f \in 1 + I$  such that  $N_f \rightarrow M_f$  is surjective.*
- (6) *If  $N \rightarrow M$  is a module map,  $N/IN \rightarrow M/IM$  is surjective,  $M$  is finite, and  $I \subset \text{rad}(R)$ , then  $N \rightarrow M$  is surjective.*
- (7) *If  $x_1, \dots, x_n \in M$  generate  $M/IM$  and  $M$  is finite, then there exists an  $f \in 1 + I$  such that  $x_1, \dots, x_n$  generate  $M_f$  over  $R_f$ .*
- (8) *If  $x_1, \dots, x_n \in M$  generate  $M/IM$ ,  $M$  is finite, and  $I \subset \text{rad}(R)$ , then  $M$  is generated by  $x_1, \dots, x_n$ .*
- (9) *If  $IM = M$ ,  $I$  is nilpotent, then  $M = 0$ .*
- (10) *If  $N, N' \subset M$ ,  $M = N + IN'$ , and  $I$  is nilpotent then  $M = N$ .*
- (11) *If  $N \rightarrow M$  is a module map,  $I$  is nilpotent, and  $N/IN \rightarrow M/IM$  is surjective, then  $N \rightarrow M$  is surjective.*
- (12) *If  $\{x_\alpha\}_{\alpha \in A}$  is a set of elements of  $M$  which generate  $M/IM$  and  $I$  is nilpotent, then  $M$  is generated by the  $x_\alpha$ .*

*Proof.* For (1). Choose generators  $y_1, \dots, y_m$  of  $M$  over  $R$ . For each  $i$  we can write  $y_i = \sum z_{ij}y_j$  with  $z_{ij} \in I$  since  $M = IM$ . In other words  $\sum_j (\delta_{ij} - z_{ij})y_j = 0$ . Let  $f$  be the determinant of the  $m \times m$  matrix  $A = (\delta_{ij} - z_{ij})$ . Note that  $f \in 1 + I$ . By Lemma 1.7.1 (1), there exists an  $m \times m$  matrix  $B$  such that  $BA = f1_{m \times m}$ . Writing out we see that  $\sum_i b_{hi}a_{ij} = f\delta_{hj}$  for all  $h$  and  $j$ ; hence,  $\sum_{i,j} b_{hi}a_{ij}y_j = \sum_j f\delta_{hj}y_j = fy_h$  for every  $h$ . In other words,  $0 = fy_h$  for every  $h$  (since each  $i$  satisfies  $\sum_j a_{ij}y_j = 0$ ). This implies that  $f$  annihilates  $M$ .

By Lemma 1.4.4 an element of  $1 + \text{rad}(R)$  is invertible element of  $R$ . Hence we see that (1) implies (2). We obtain (3) by applying (1) to  $M/N$  which is finite as  $N'$  is finite. We obtain (4) by applying (2) to  $M/N$  which is finite as  $N'$  is finite. We obtain (5) by applying (3) to  $M$  and the submodules  $\text{Im}(N \rightarrow M)$  and  $M$ . We obtain (6) by applying (4) to  $M$  and the submodules  $\text{Im}(N \rightarrow M)$  and  $M$ . We obtain (7) by applying (5) to the map  $R^{\oplus n} \rightarrow M$ ,  $(a_1, \dots, a_n) \mapsto a_1x_1 + \dots + a_nx_n$ . We obtain (8) by applying (6) to the map  $R^{\oplus n} \rightarrow M$ ,  $(a_1, \dots, a_n) \mapsto a_1x_1 + \dots + a_nx_n$ .

Part (9) holds because if  $M = IM$  then  $M = I^nM$  for all  $n \geq 0$  and  $I$  being nilpotent means  $I^n = 0$  for some  $n \gg 0$ . Parts (10), (11), and (12) follow from (9) by the arguments used above.  $\square$

**Lemma 1.7.3.** *Let  $R$  be a ring, let  $S \subset R$  be a multiplicative subset, let  $I \subset R$  be an ideal, and let  $M$  be a finite  $R$ -module. If  $x_1, \dots, x_r \in M$  generate  $S^{-1}(M/IM)$  as an  $S^{-1}(R/I)$ -module, then there exists an  $f \in S + I$  such that  $x_1, \dots, x_r$  generate  $M_f$  as an  $R_f$ -module.<sup>1</sup>*

*Proof.* Special case  $I = 0$ . Let  $y_1, \dots, y_s$  be generators for  $M$  over  $R$ . Since  $S^{-1}M$  is generated by  $x_1, \dots, x_r$ , for each  $i$  we can write  $y_i = \sum (a_{ij}/s_{ij})x_j$  for some  $a_{ij} \in R$  and  $s_{ij} \in S$ . Let  $s \in S$  be the product of all of the  $s_{ij}$ . Then we see that  $y_i$  is contained in the  $R_s$ -submodule of  $M_s$  generated by  $x_1, \dots, x_r$ . Hence  $x_1, \dots, x_r$  generates  $M_s$ .

General case. By the special case, we can find an  $s \in S$  such that  $x_1, \dots, x_r$  generate  $(M/IM)_s$  over  $(R/I)_s$ . By Nakayama's Lemma 1.7.2 we can find a  $g \in 1 + I_s \subset R_s$  such that  $x_1, \dots, x_r$  generate  $(M_s)_g$  over  $(R_s)_g$ . Write  $g = 1 + i/s'$ . Then  $f = ss' + is$  works; details omitted.  $\square$

## 1.8 The Spectrums of a Ring

### 1.8.1 Fundamental Diagram of Ring Maps

**Proposition 1.8.1.** *A fundamental commutative diagram associated to a ring map  $\varphi : R \rightarrow S$ , a prime  $\mathfrak{q} \subset S$  and the corresponding prime  $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$  of  $R$  is the*

<sup>1</sup>Special cases: (I)  $I = 0$ . The lemma says if  $x_1, \dots, x_r$  generate  $S^{-1}M$ , then  $x_1, \dots, x_r$  generate  $M_f$  for some  $f \in S$ . (II)  $I = \mathfrak{p}$  is a prime ideal and  $S = R \setminus \mathfrak{p}$ . The lemma says if  $x_1, \dots, x_r$  generate  $M \otimes_R \kappa(\mathfrak{p})$  then  $x_1, \dots, x_r$  generate  $M_f$  for some  $f \in R$ ,  $f \notin \mathfrak{p}$ .

following:

$$\begin{array}{ccccccccc}
 \kappa(\mathfrak{q}) = S_{\mathfrak{q}}/\mathfrak{q}S_{\mathfrak{q}} & \longleftarrow & S_{\mathfrak{q}} & \longleftarrow & S & \longrightarrow & S/\mathfrak{q} & \longrightarrow & \kappa(\mathfrak{q}) \\
 \uparrow & & \uparrow & & \uparrow & & \uparrow & & \uparrow \\
 \kappa(\mathfrak{p}) \otimes_R S = S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}} & \longleftarrow & S_{\mathfrak{p}} & \longleftarrow & S & \longrightarrow & S/\mathfrak{p}S & \longrightarrow & (R \setminus \mathfrak{p})^{-1}S/\mathfrak{p}S \\
 \uparrow & & \uparrow & & \uparrow \varphi & & \uparrow & & \uparrow \\
 \kappa(\mathfrak{p}) = R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}} & \longleftarrow & R_{\mathfrak{p}} & \longleftarrow & R & \longrightarrow & R/\mathfrak{p} & \longrightarrow & \kappa(\mathfrak{p})
 \end{array}$$

In this diagram the arrows in the outer left and outer right columns are identical. The horizontal maps induce on the associated spectra always a homeomorphism onto the image. The lower two rows of the diagram make sense without assuming  $\mathfrak{q}$  exists. The lower squares induce fibre squares of topological spaces. This diagram shows that  $\mathfrak{p}$  is in the image of the map on  $\text{Spec}$  if and only if  $S \otimes_R \kappa(\mathfrak{p})$  is not the zero ring.
